

Hard Surface Materials Cleanability Overview

Our diverse portfolio of hard surface materials and finishes provides various solutions for cleaning and disinfecting needs. Each material has its own performance attributes that offer benefits for workspaces, healthcare environments, cafeterias, collaborative spaces, and other high traffic areas.

Cleaning a surface uses soap or detergent to remove debris, dirt, and dust on surfaces, paying particular attention to areas where higher levels of touch may occur.

Disinfecting kills microscopic organisms (germs, viruses, fungi) on surfaces by using EPA-approved products that kill the organisms and prevent them from spreading.

Following are recommendations for cleaning and disinfecting Herman Miller's standard hard surface materials.

Bleach Cleanability and Disinfecting

Bleach Cleanability

It is recommended to avoid bleach cleaning of hard surface materials because it corrodes metal, damages environmental surfaces, is inactivated by organic matter, and is toxic.

Bleach Disinfecting

The use of a bleach solution of one-part bleach to ten parts water may occur for infrequent disinfecting of hard surface materials, but as with bleach cleaning, it corrodes metal, damages environmental surfaces, is inactivated by organic matter, and is toxic.

Disinfecting products with a pH factor between 7 and 9 are suitable; a disinfecting product with a pH of 10.5 or higher may damage the integrity of hard surfaces.
